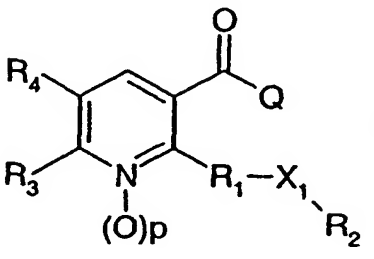
(54) Title: SUBSTITUTED PYRIDINE HERBICIDES



(I)

(57) Abstract: Compounds of the formula (I) in which the substituents are as defined in claim 1 are suitable for use as herbicides.

SUBSTITUTED PYRIDINE HERBICIDES

The present invention relates to novel herbicidally active pyridine ketones, to processes for their preparation, to compositions which comprise these compounds, and to their use for controlling weeds, in particular in crops of useful plants, or for inhibiting plant growth.

Pyridine ketones having herbicidal action are described, for example, in WO 00/15615 and WO/0039094.

We have now found novel pyridine ketones having herbicidal and growth-inhibiting properties.

The present invention thus provides compounds of the formula I

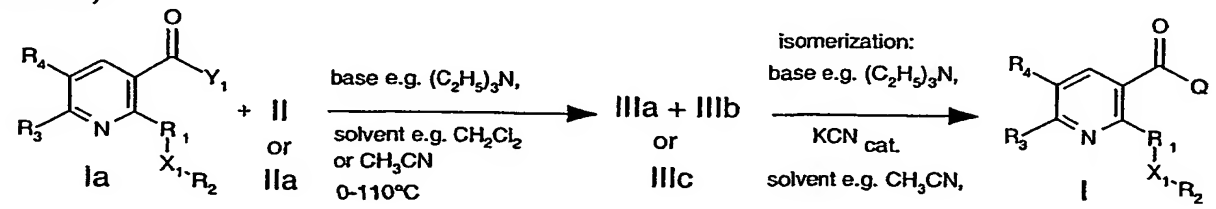
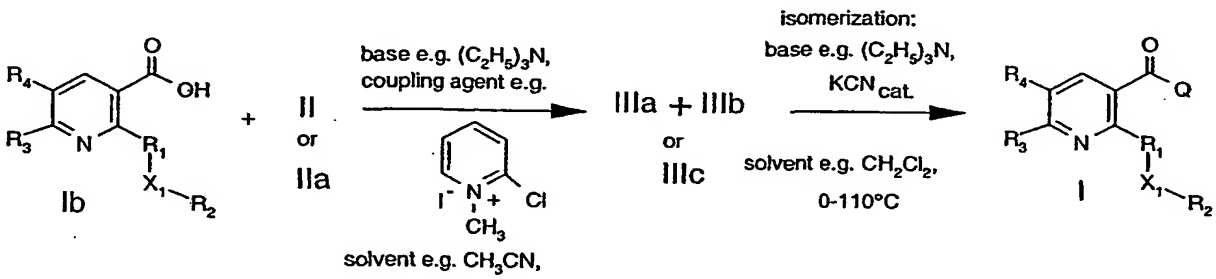
The preparation of the compounds of the formula I is illustrated in more detail in reaction schemes 1 and 2 below.

Reaction scheme 1

Route a):

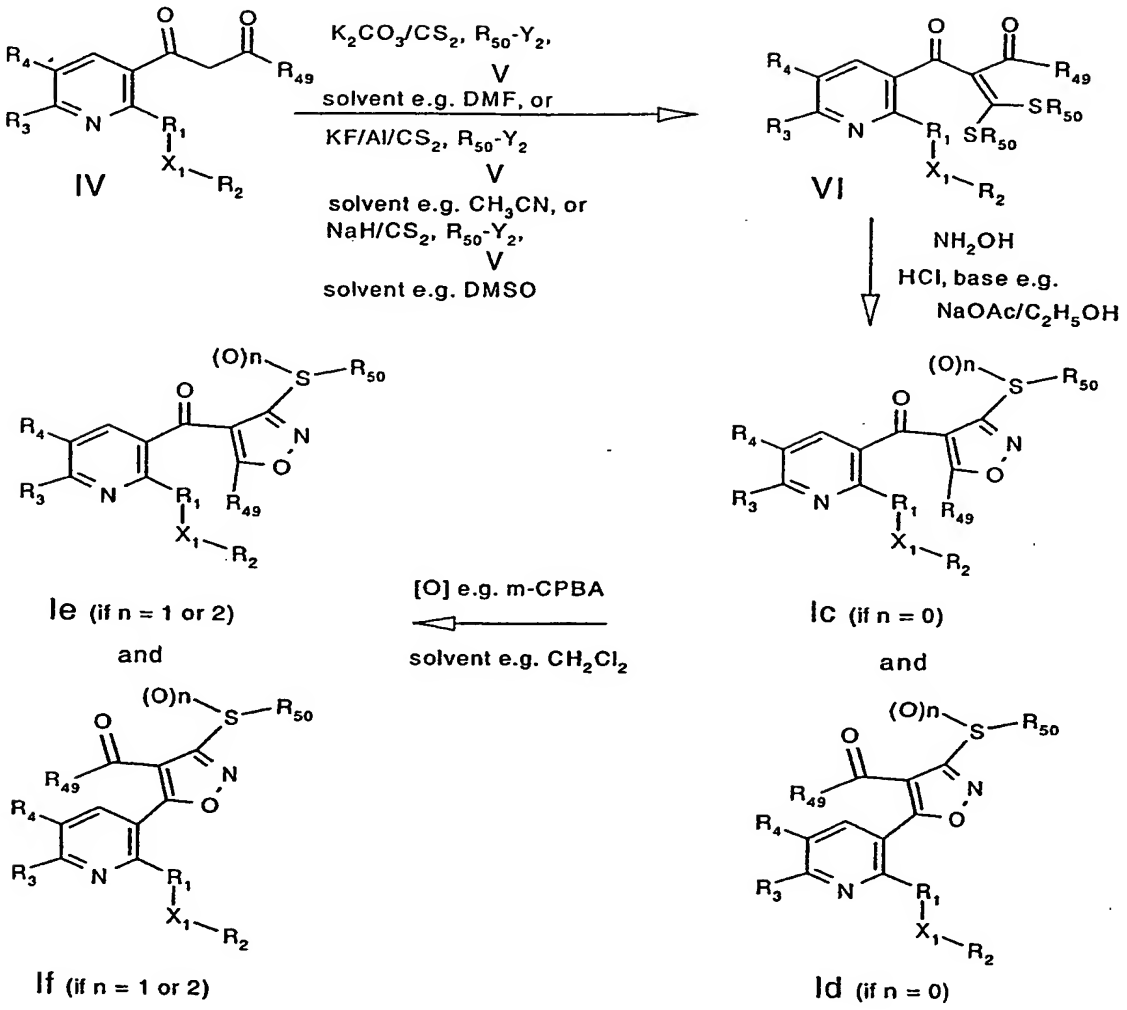


Route b):



Reaction scheme 1 is preferably used to prepare the compounds of the formula I having the group Q_1, in which R_{13} is hydroxyl, and the compounds of the formula I having the group Q_2, in which R_{36} is hydroxyl.

Reaction scheme 2



Compounds of the formula I, in which p is 1, i.e. the corresponding N-oxides of the formula I, can be prepared by reacting a compound of the formula I, in which p is 0, with a suitable oxidizing agent, for example the H_2O_2/urea adduct in the presence of an acid anhydride, e.g. trifluoroacetic anhydride. Such oxidations are known from the literature, for example from *J. Med. Chem.*, *32* (12), 2561-73, **1989** or WO 00/15615.

According to reaction scheme 1, route a), the carboxylic acid derivatives of the formula Ia in which Y_1 is a leaving group such as halogen, for example iodine, bromine, and in particular chlorine, N-oxyphthalimide or N,O-dimethylhydroxylamino or part of an activated ester, for example  (formed from dicyclohexylcarbodiimide (DCC) and the

corresponding carboxylic acid) or $C_2H_5N{=}C(O^-){-}NH(CH_2)_3N(CH_3)_2$ (formed from N-ethyl N'-(3-dimethylaminopropyl)carbodiimide (EDC) and the corresponding carboxylic acid) are used as starting materials for preparing the compounds of the formula I in which Q denotes the groups Q_1 and Q_2 and R_{13} and R_{36} are hydroxyl. The starting materials are reacted in an inert organic solvent such as a halogenated hydrocarbon, for example dichloromethane, a nitrile, for example acetonitrile, or an aromatic hydrocarbon, for example toluene, and in the presence of a base such as an alkylamine, for example triethylamine, an aromatic amine, for example pyridine or 4-dimethylaminopyridine (DMAP) with the dione derivatives of the formula II or pyrazoles of the formula IIa, to give the isomeric enol ethers of the formula IIIa, IIIb or IIIc. This esterification can be carried out at temperatures of from 0°C to 110°C.

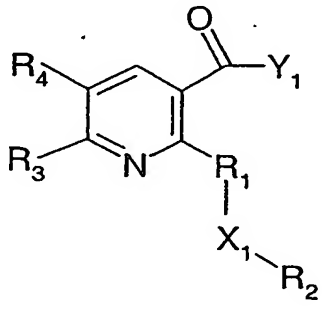
The isomerization of the ester derivatives of the formulae IIIa, IIIb and IIIc to derivatives of the formula I (in which R_{13} and R_{36} are hydroxyl) can be carried out, for example, similarly to EP-A-0 353 187, EP-A-0 316 491 or WO 97/46530 in the presence of a base such as an alkylamine, for example triethylamine, a carbonate, for example potassium carbonate, and a catalytic amount of DMAP or a source of cyanide, such as acetone cyanohydrin or potassium cyanide. In particular if a cyanide compound of the formula Ia (Y_1 = cyano) is used, or in the presence of a catalytic amount of acetone cyanohydrin or potassium cyanide, the two reaction steps can be carried out *in situ* without isolating the intermediates III.

According to reaction scheme 1, route b), the desired derivatives of the formula I (in which R_{13} and R_{36} are hydroxyl) can be obtained, for example, similarly to E. Haslem, *Tetrahedron*, 2409-2433, *36*, **1980**, by esterifying the carboxylic acids of the formula Ib with the dione derivatives of the formula II or pyrazoles of the formula IIa in an inert solvent such as a halogenated hydrocarbon, for example dichloromethane, a nitrile, for example acetonitrile, or an aromatic hydrocarbon, for example toluene, in the presence of a base such as an alkylamine, for example triethylamine, and a coupling agent such as 2-chloro-1-methyl-pyridinium iodide. Depending on the solvent used, this esterification is carried out at temperatures of from 0°C to 110°C, giving initially, as described under route a), the isomeric ester of the formula IIIa, IIIb or IIIc, which can be isomerized as described under route a), for example in the presence of a base and a catalytic amount of DMAP, or a source of cyanide, for example acetone cyanohydrin, to give the desired derivative of the formula I (R_{13} and R_{36} = hydroxyl). The activated carboxylic acid derivatives of the formula Ia in reaction scheme 1 (route a), in which Y_1 is a leaving group such as halogen, for example bromine, iodine or, in particular, chlorine, can be prepared by known standard processes, for example

those described in C. Ferri "Reaktionen der organischen Synthese" [Reactions of organic sythesis], Georg Thieme Verlag, Stuttgart, 1978, page 460 ff. Such reactions are generally known and described in the literature in different variations with respect to the leaving group Y_1.

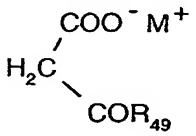
The preparation of the compounds of the formula I, in which Q denotes the group Q_3, can be carried out according to reaction scheme 2 by reacting the β-diketone derivative of the formula IV for example similarly to *Synthesis* **1991**, 301; ibid. **1988**, 793; or *Tetrahedron 32*, 3055, **1976**, with carbon disulfide in the presence of a base such as a carbonate, for example potassium carbonate, a metal hydride, for example sodium hydride, or potassium fluoride on aluminum, and an alkylating agent of the formula V, in which Y_2 is a leaving group such as halogen, for example iodine, bromine and, in particular, chlorine, CH_3SO_2O- or  . This reaction is expediently carried out in a solvent such as an amide, for example N,N-dimethylformamide (DMF), a sulfoxide, for example dimethyl sulfoxide (DMSO), or a nitrile, for example acetonitrile. The ketene thioacetal of the formula VI that is formed is cyclized with the aid of hydroxylamine hydrochloride in the presence of a base such as sodium acetate in a solvent such as an alcohol, for example ethanol, or an ether, for example tetrahydrofuran, to give the isomeric compounds of the formulae Ic and Id (in which n is 0). This cyclization reaction is carried out at temperatures of from 0°C to 100°C. If appropriate, the compounds of the formulae Ic and Id in which n is 0 can be oxidized similarly to known standard processes as described, for example, in H. O. House, "Modern Synthetic Reactions", W. A. Benjamin, Inc., Menlo Park, California, 1972, pages 334-335 and 353-354, to give the corresponding sulfones and sulfoxides of the formulae Ie and If (n = 1 or 2).

The compounds of the formula IV in reaction scheme 2 can be obtained by standard processes for example from the corresponding compounds of the formula Ia



(Ia),

in which R_1, R_2, R_3, R_4, and X_1 are as defined above and Y_1 is a leaving group, for example halogen, for example by Claisen condensation, or from the compounds of the formula Ia by reaction with a ketocarboxylic acid salt of the formula VII

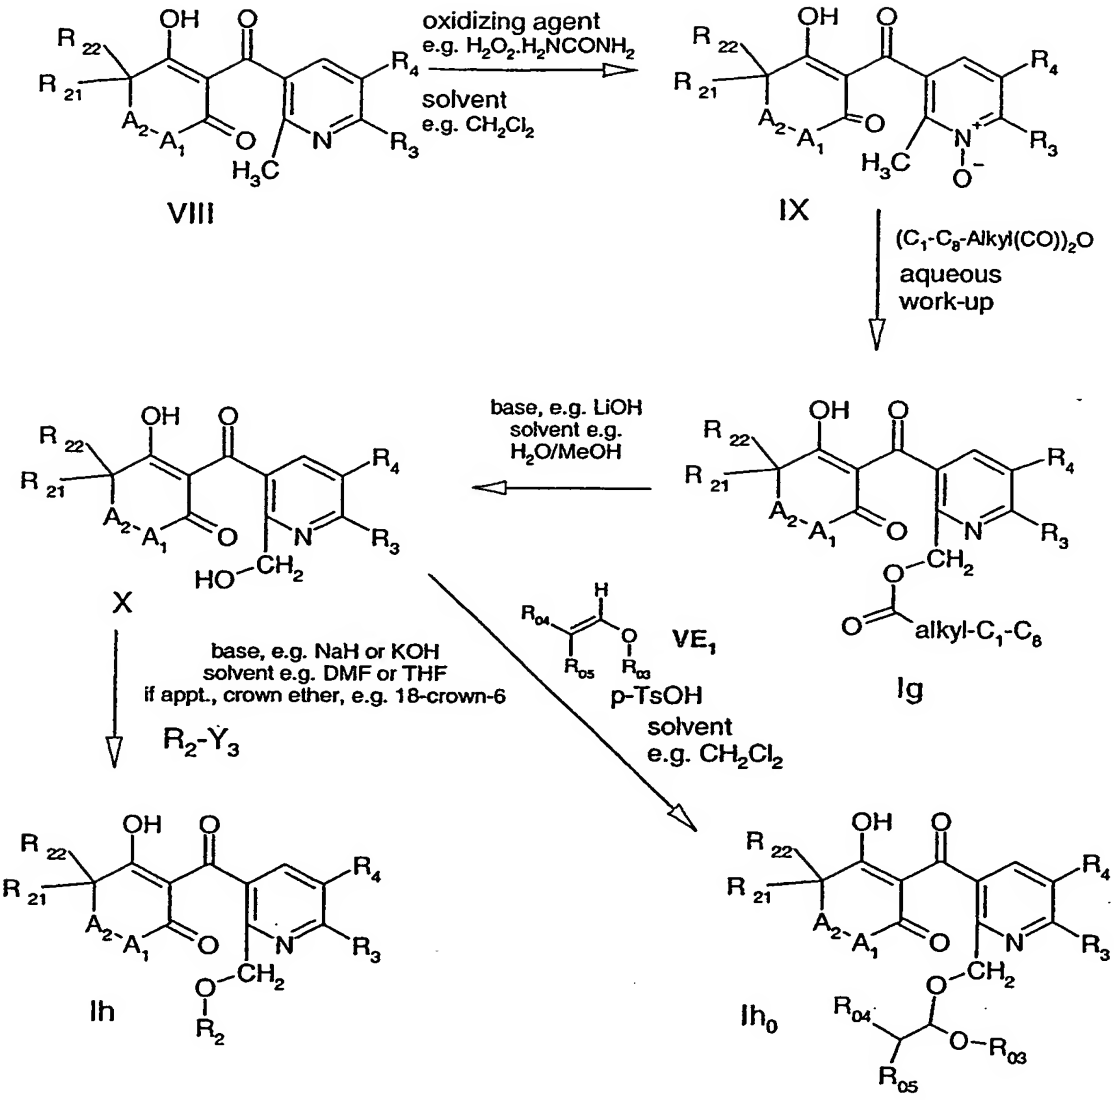


(VII),

in which R_{49} is as defined under formula I and M^+ is an alkali metal ion (cf., for example, WO 96/26192).

Compounds of the formula I, in which R_1 is, in particular C_1-C_2alkyl, can, for example, also be prepared by heating an N-oxide of the formula IX under known reaction conditions in the presence of an acid anhydride (see, for example, Konno, K.; Hashimoto, K.; Shirahama, H.; Matsumoto, T.; *Heterocycles* **1986**, 24, 2169, or WO 00/15615) and hydrolyzing the resulting products (Ig) in a protic solvent, for example water or a water/methanol mixture, if appropriate in the presence of a base (for example lithium hydroxide or sodium hydroxide), and then converting the resulting alcohol X in the presence of a base, for example sodium hydride or potassium hydroxide, if appropriate in the presence of a phase-transfer catalyst or a crown ether, and an alkylating agent R_2-Y_3, in which R_2 is as defined under formula I and Y_3 is a leaving group, for example halogen or methyl sulfonate, in an aprotic solvent, for example, tetrahydrofuran or dimethylformamide, into the corresponding derivatives of the formula Ih (in which X_1 is oxygen). Compounds of the formula I, in which R_2 is C_1-C_6alkoxymethyl or 2-tetrahydropyranyl or 2-tetrahydrofuryl, can be prepared, for example, by treating an alcohol of the formula X with a vinyl ether of the formula VE_1, in which R_{03}, R_{04}, and R_{05} are C_1-C_6alkyl or R_{03} together with R_{05} forms a C_2-C_3alkylene chain, in the presence of an acidic catalyst, for example para-toluenesulphonic acid, in an inert solvent, for example methylene chloride. Such reactions are generally known in the literature (see, for example, *Synthesis*, p. 169, **1973**). The two reaction sequences are demonstrated using the example below:

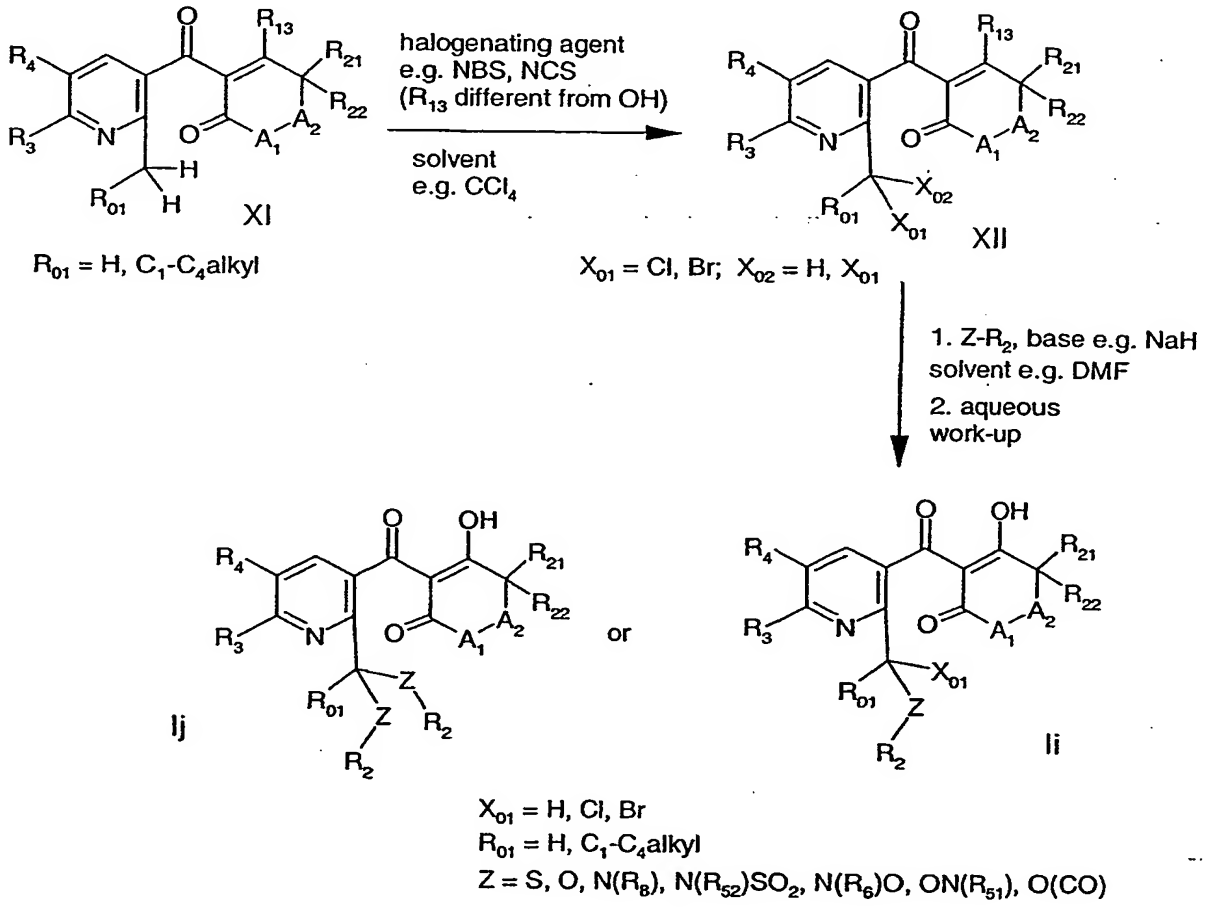
Reaction scheme 3



Compounds of the formula I, in which R_1 is, in particular, C_1-C_2alkyl or C_1-C_2haloalkyl, can, for example, also be prepared by oxidzing a compound of the formula XI, in which R_{13} is in particular chlorine, C_1-C_4alkoxycarbonyloxy or benzoylcarbonyloxy (prepared similarly to WO 00/15615 or WO/0039094), under known halogenation conditions using, for example, N-bromosuccinimide or N-chlorosuccinimide in the presence of light and a free-radical initiator such as benzoyl peroxide to give the 1-bromo or 1-chloro, 1,1-dibromo or 1,1-dichloro compound and then refunctionalizing these compounds into the corresponding derivatives of the formula I, for example by reaction with a nucleophile R_2-Z, in which Z is, for example, -SH, -OH, -C(O)OH, -O-N(R_{51})H, -N(R_6)-OH, -SO_2N(R_{52})H or -N(R_8)H and R_2, R_{52},

R_8, R_6 and R_{51} are as defined under formula I, in the presence of a base, for example sodium hydride, potassium hydroxide or potassium carbonate, followed by aqueous work-up. These reaction sequences, too, are demonstrated by the example below.

Reaction scheme 4



Compounds of the formula I, in which Q denotes Q_1 or Q_2 and in which R_{13} or R_{36} are different from hydroxyl or halogen, can be prepared by conversion processes generally known from the literature, for example acylations or carbamoylations with appropriate acid chlorides from compounds of the formula I, in which R_{13} or R_{36} is hydroxyl, in the presence of a suitable base, or they can be prepared by nucleophilic substitution reactions on chlorides of the formula I, in which R_{13} and R_{36} are chlorine, the chlorides likewise being obtainable according to known processes by reaction with a chlorinating agent, such as phosgene, thionyl chloride or oxalyl chloride. The starting materials used are, for example, appropriately substituted amines, or hydroxylamines directly, or alkylsulfonamides, mercaptans,

thiophenols, phenols, heterocyclic amines or heterocyclic thiols in the presence of a base, for example 5-ethyl-2-methylpyridine, diisopropylethylamine, triethylamine, sodium bicarbonate, sodium acetate or potassium carbonate.

Compounds of the formula I, in which R_{13} and R_{36} contain thio groups, can be oxidized similarly to known standard processes using, for example, peracids, for example meta-chloroperbenzoic acid (m-CPBA) or peracetic acid, to give the corresponding sulfones and sulfoxides of the formula I. The degree of oxidation at the sulfur atom (SO- or SO_2-) can be controlled by the amount of oxidizing agent.

The resulting derivatives of the formula I, in which R_{13} and R_{36} are different from hydroxyl, can likewise occur in different isomeric forms which, if appropriate, can be isolated in pure form. Accordingly, the invention also embraces all of these stereoisomeric forms. Examples of these isomeric forms are the formulae I*, I** and I*** below in which Q denotes the group Q_1.

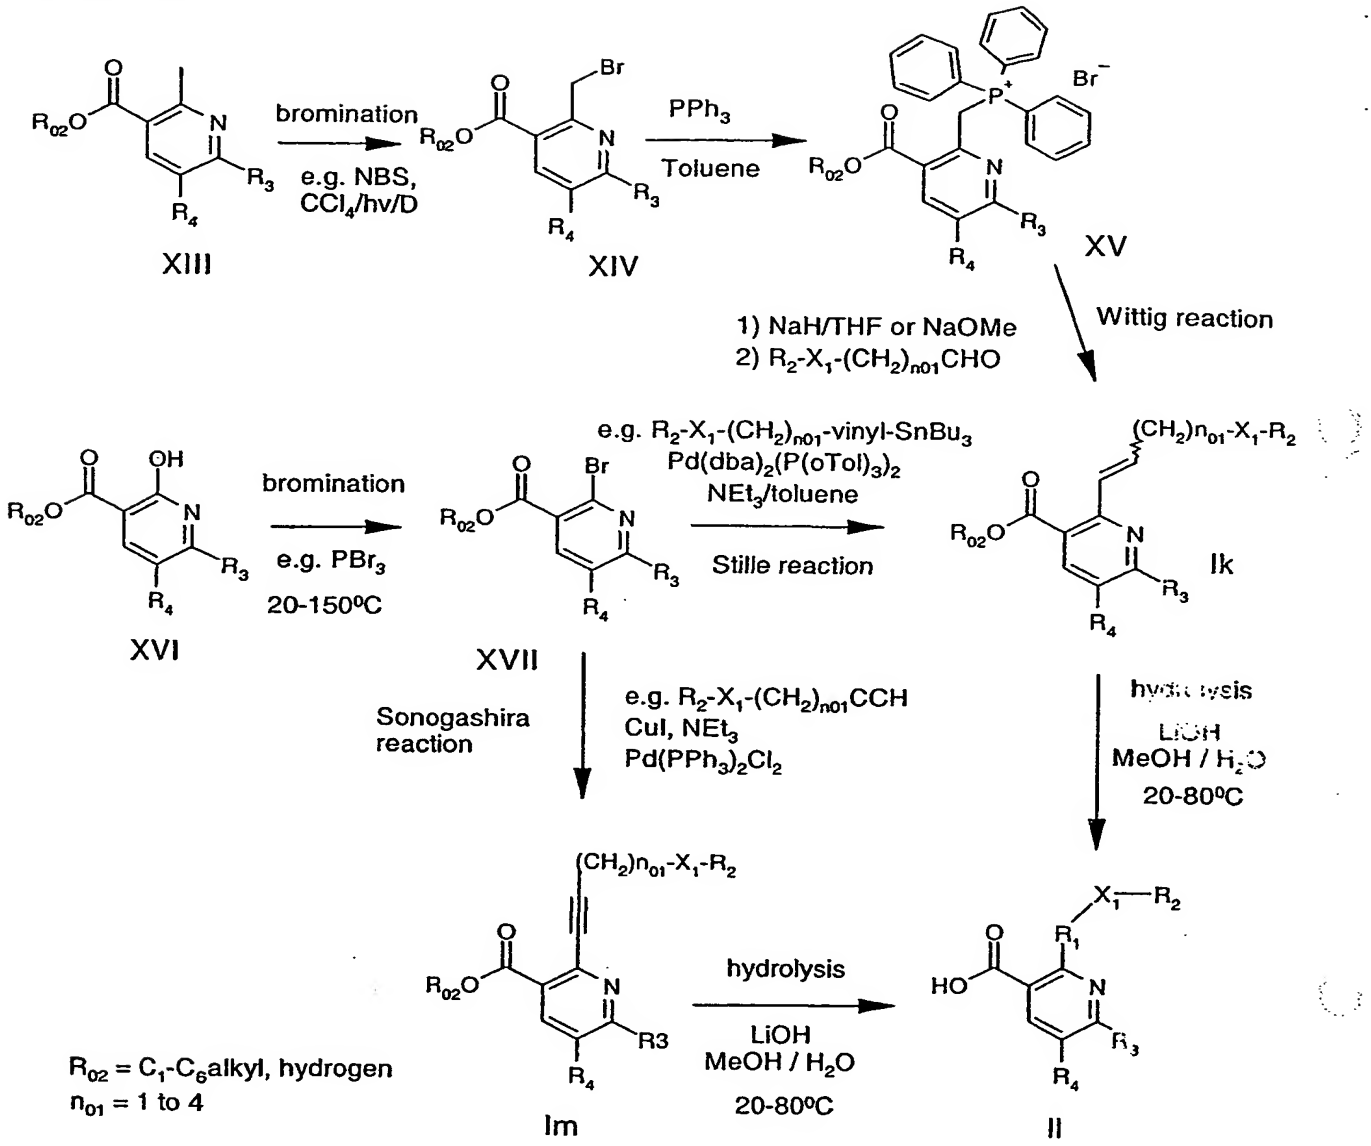
The compounds of the formulae II and IIa are known and can be prepared similarly as described, for example, in WO 92/07837, JP 10265441, DE-A-3818958, EP-A-0 338 992, DE-A-3902818, EP-A-0 278 742, WO 98/29412, JP 02059566, US-A-5,089,046, GB-A-2205316, WO 00/27821 or EP-A-0 384 736.

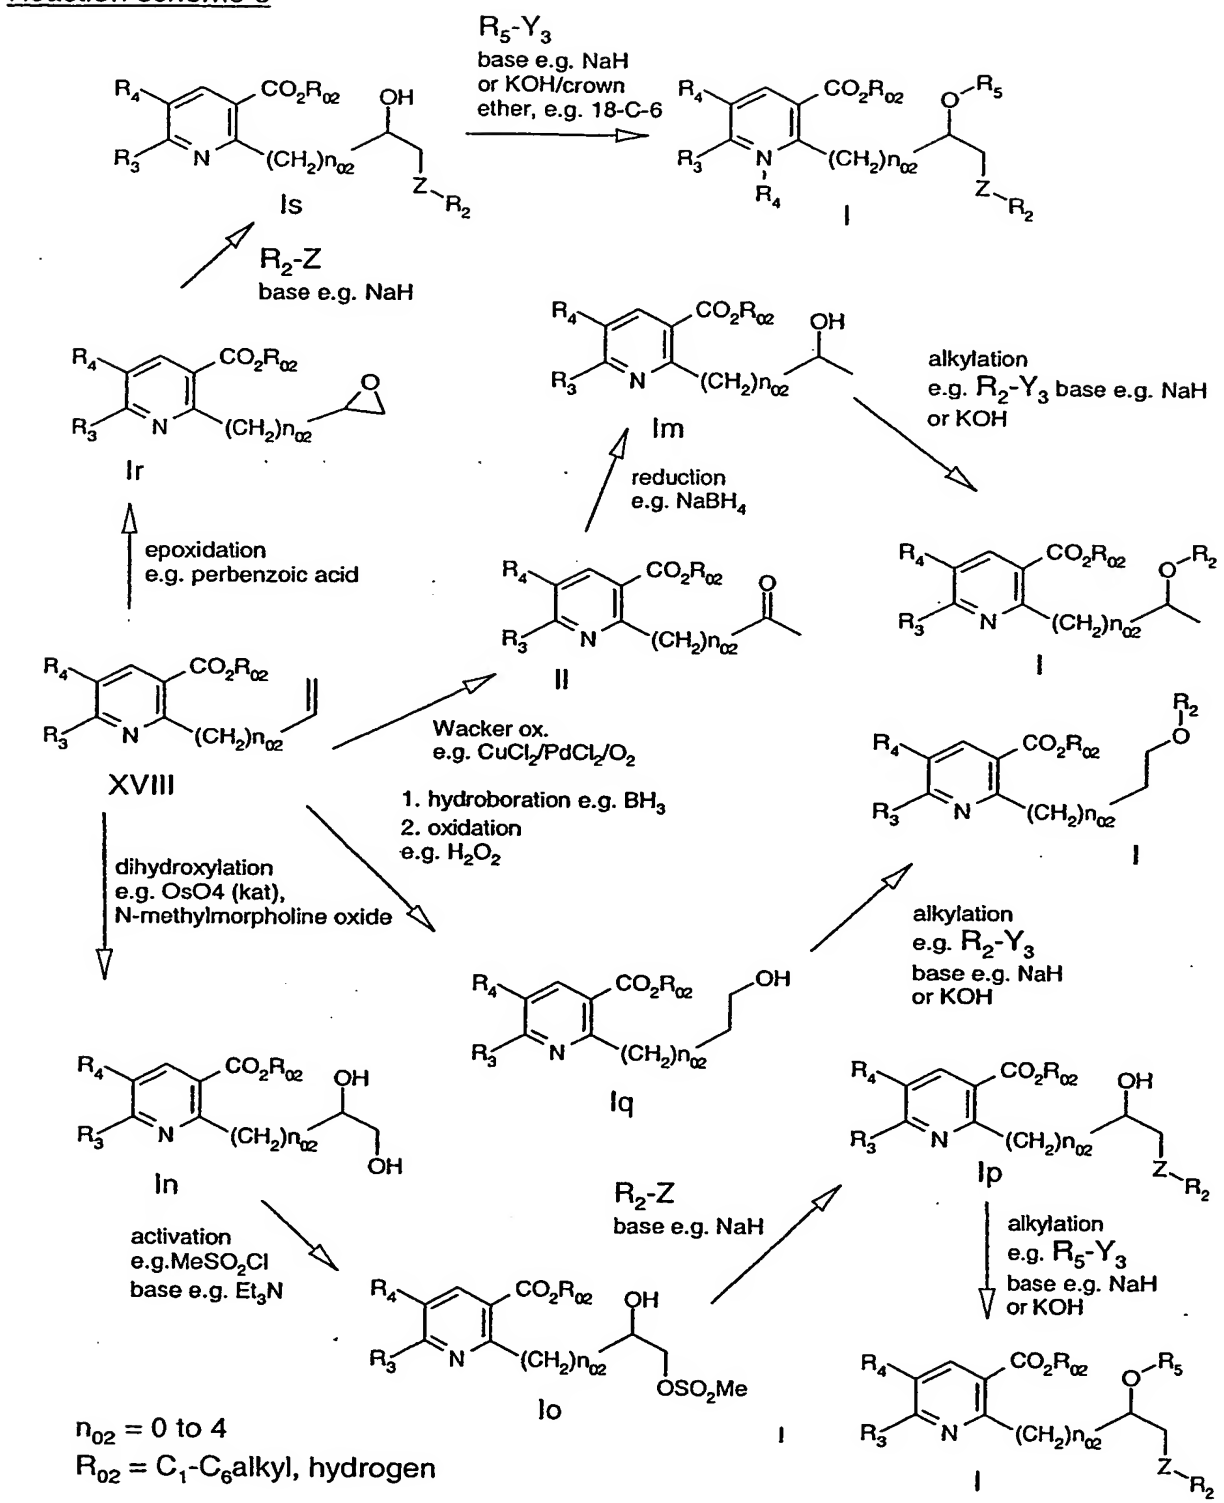
The required intermediates of the formula Ib (or Ik, Il or Im) are synthesized similarly to known processes as described, for example, in WO 00/15615, WO/00/39094 or WO 97/46530, or they can be prepared for example, according to generally known conversion methods such as the Stille (see, for example *Angew. Chem.* **1986**, *98*(6), 504-19), Heck (see, for example, *Angew. Chem.* **1994**, *106* (23/24), 2473-506), Sonogashira (see, for example, *"Comprehensive Organometallic Synthesis"*, Pergamon Verlag, Oxford, Vol 3, **1991**, page 521 ff.) or Wittig (for example C. Ferri *"Reaktionen der organischen Synthese"*, Georg Thieme Verlag, Stuttgart, **1978**, p. 354 ff.) reactions, starting from halogen derivatives of the formula XIV (preparation as described in WO 00/15615 or WO/0039094) or XVII (preparation similar to EP 522392) (reaction scheme 5):

Reaction scheme 5



Intermediates of the formula Ib, in which R_1, R_2, R_3, R_4 and X_1 are as defined under formula I, can also be prepared by the method according to reaction scheme 6:

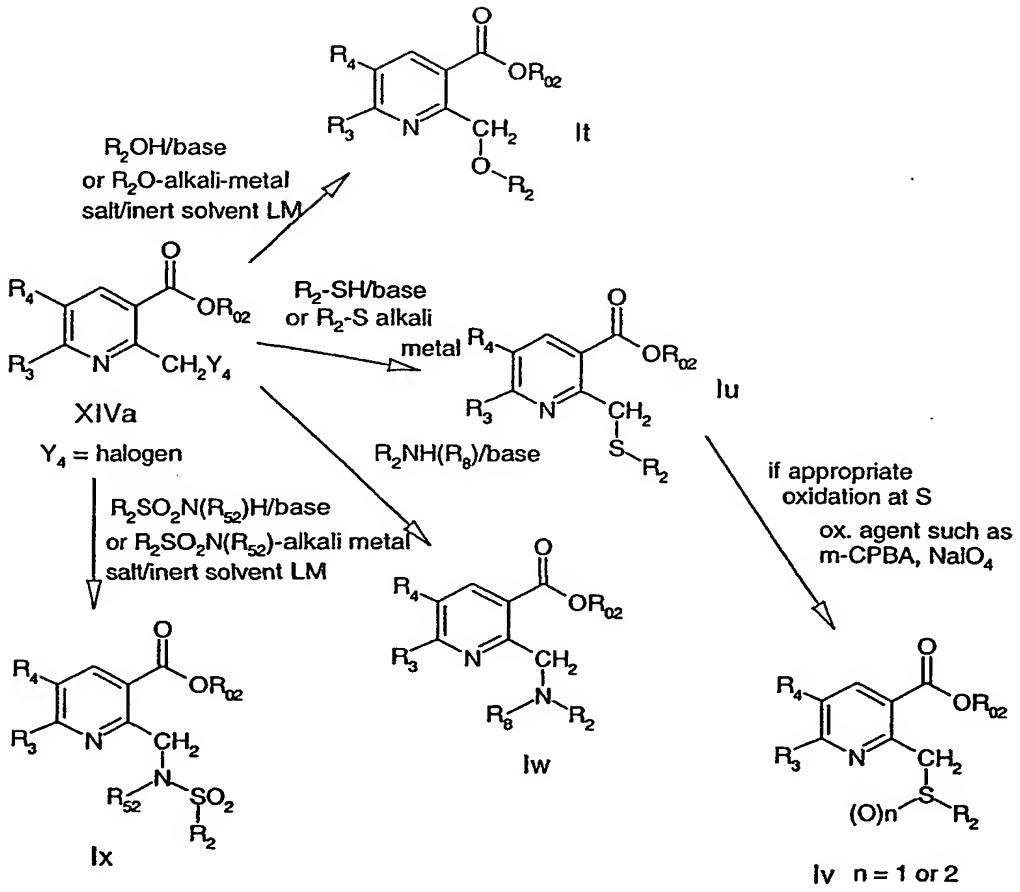
Reaction scheme 6



Using generally known oxidation methods such as dihydroxylation, Wacker oxidation, epoxidation, hydroboration with subsequent oxidation, starting with vinyl or allyl compounds of the formula XVIII (preparation as described in WO 00/15615 or WO/0039094), intermediates of the formulae Il, In, Iq and Ir are obtained which can be converted by conversion processes known to the person skilled in the art (for example alcohol activation, for example as sulfonate, alkylation, for example using an alkylating agent R_2-Y_3 or R_5-Y_3, in which R_2 and R_5 are as defined under formula I and Y_3 is a leaving group, for example halogen), in the presence of a base, or using nucleophile reactions, for example with a nucleophile Z-R_2, in which Z and R_2 are as defined above, into compounds of the formula I.

Intermediates of the formula Ib, in which R_1 is C_1-C_2alkyl and R_2, R_3, R_4 and X_1 are as defined under formula I, can also be prepared by reacting a compound of the formula XIVa, in which R_3 and R_4 are as defined above under formula I and Y_4 is halogen, with a nucleophile R_2-Z, in which Z is -SH, -OH, -C(O)OH, -O-N(R_{51})H, -N(R_6)-OH -SO_2N(R_{52})H or -N(R_8)H and R_2, R_{52}, R_8, R_6, R_{51} are as defined above under formula I, in the presence of a base such as sodium hydride or an alkaline earth metal oxide or carbonate in an inert solvent such as dimethylformamide or THF at temperatures between –5 and 160°C, or, to prepare the corresponding sulfinyl or sulfonyl derivatives of the formula Iu, by reacting with an oxidizing agent such as m-chloroperbenzoic acid or sodium periodate, or sodium perborate, with, depending on the degree of oxidation, temperature control known to the person skilled in the art (for example –30°C–+50°C for n=1 and –20°C–+100°C for n=2 respectively) , in an inert solvent such as dichloromethane, to give compound of the formula Iv. In reaction scheme 7 below, this is illustrated in more detail for the case Z = OH, SH, SO_2N(R_{52})H and N(R_8)H:

Reaction scheme 7



Intermediates of the formula I, in which Q denotes a group OR_{02} (R_{02} = C_1-C_6alkyl), can be converted by hydrolysis using, for example, a base, for example LiOH, in a protic solvent, for example H_2O or H_2O/methanol mixtures, into products of the formula Ib.

For preparing all further compounds of the formula I functionalized according to the definitions of R_1, R_2, R_3, R_4 and X_1, there are a large number of suitable known standard methods, for example alkylation, halogenation, acylation, amidation, oximation, oxidation and reduction, the choice of the preparation methods which are suitable depending on the properties (reactivity) of the substituents in the intermediates.

The reactions to give compounds of the formula I are advantageously carried out in aprotic inert organic solvents. Such solvents are hydrocarbons such as benzene, toluene, xylene or cyclohexane, chlorinated hydrocarbons such as dichloromethane, trichloromethane, tetrachloromethane or chlorobenzene, ethers such as diethyl ether, ethylene glycol dimethyl

ether, diethylene glycol dimethyl ether, tetrahydrofuran or dioxane, nitriles such as acetonitrile or propionitrile, amides such as N,N-dimethylformamide, diethylformamide or N-methylpyrrolidinone. The reaction temperatures are advantageously between -20°C and +120°C. In general, the reactions are slightly exothermic and, as a rule, they can be carried out at room temperature. To shorten the reaction time, or else to start the reaction, the mixture may be heated briefly to the boiling point of the reaction mixture. The reaction times can also be shortened by adding a few drops of base as reaction catalyst. Suitable bases are, in particular, tertiary amines such as trimethylamine, triethylamine, quinuclidine, 1,4-diazabicyclo[2.2.2]octane, 1,5-diazabicyclo[4.3.0]non-5-ene or 1,5-diazabicyclo-[5.4.0]undec-7-ene. However, inorganic bases such as hydrides, e.g. sodium hydride or calcium hydride, hydroxides, e.g. sodium hydroxide or potassium hydroxide, carbonates such as sodium carbonate and potassium carbonate, or hydrogen carbonates such as potassium hydrogen carbonate and sodium hydrogen carbonate may also be used as bases. The bases can be used as such or else with catalytic amounts of a phase-transfer catalyst, for example a crown ether, in particular 18-crown-6, or a tetraalkylammonium salt.

The compounds of the formula I can be isolated in the customary manner by concentrating and/or by evaporating the solvent and purified by recrystallization or trituration of the solid residue in solvents in which they are not readily soluble, such as ethers, aromatic hydrocarbons or chlorinated hydrocarbons.

All application methods which are conventionally used in agriculture, for example pre-emergence application, post-emergence application and seed treatment, as well as various methods and techniques, for example the controlled release of active ingredients, are suitable for the use according to the invention of the compounds of the formula I or of compositions comprising them. To this end, the active ingredient in solution is applied to mineral carriers for granules or to polymerized granules (urea/formaldehyde) and dried. If appropriate, an additional coating can be applied (coated granules), which allows the active ingredient to be released in a controlled manner over a specific period of time.

The compounds of the formula I can be employed as herbicides as such, i.e. as obtained from synthesis. However, they are preferably processed in the customary manner together with the auxiliaries conventionally used in the art of formulation, for example to give emulsifiable concentrates, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granules or microcapsules. Such formulations are described, for example, in WO 97/34485 on pages 9 to 13. The application methods such as

spraying, atomizing, dusting, wetting, scattering or pouring, as well as the type of composition, are chosen to suit the intended aims and the prevailing circumstances.

The formulations, i.e. the compositions, preparations or products which comprise the active ingredient of the formula I or at least one active ingredient of the formula I and, as a rule, one or more solid or liquid formulation auxiliaries, are prepared in the known manner, for example by intimately mixing and/or grinding the active ingredients together with the formulation auxiliaries, for example solvents or solid carriers. Furthermore, surface-active compounds (surfactants) may additionally be used when preparing the formulations. Examples of solvents and solid carriers are indicated for example in WO 97/34485 on page 6.

Suitable surface-active compounds are, depending on the nature of the active ingredient of the formula I to be formulated, nonionic, cationic and/or anionic surfactants and surfactant mixtures which have good emulsifying, dispersing and wetting properties. Examples of suitable anionic, nonionic and cationic surfactants are enumerated, for example, in WO 97/34485 on pages 7 and 8. The surfactants conventionally used in the art of formulation which are described, inter alia, in "McCutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1981, Stache, H., "Tensid-Taschenbuch" ["Surfactants Guide"], Carl Hanser Verlag, Munich/Vienna, 1981 and M. and J. Ash, "Encyclopedia of Surfactants", Vol I-III, Chemical Publishing Co., New York, 1980-81 are furthermore also suitable for preparing the herbicidal compositions according to the invention.

As a rule, the herbicidal formulations comprise 0.1 to 99% by weight, in particular 0.1 to 95% by weight, of herbicide, 1 to 99.9% by weight, in particular 5 to 99.8% by weight, of a solid or liquid formulation auxiliary and 0 to 25% by weight, in particular 0.1 to 25% by weight, of a surfactant. While concentrated compositions are more preferred as commercially available goods, the end consumer uses, as a rule, dilute compositions. The compositions can also comprise further additives such as stabilizers, for example epoxidized or non-epoxidized vegetable oils (epoxidized coconut oil, rapeseed oil or soya oil), antifoams, e.g. silicone oil, preservatives, viscosity regulators, binders, tackifiers and fertilizers or other active ingredients.

As a rule, the active ingredients of the formula I are applied to the plant or its environment at rates of 0.001 to 4 kg/ha, in particular 0.005 to 2 kg/ha. The dosage required for the desired

action can be determined by experiments. It depends on the type of the action, the developmental stage of the crop plant and of the weed, and on the application (location, timing, method) and can, owing to these parameters, vary within wide limits.

The compounds of the formula I are distinguished by herbicidal and growth-inhibitory properties which allow them to be employed in crops of useful plants, in particular in cereals, cotton, soya, sugar beet, sugar cane, plantation crops, rapeseed, maize and rice and for the non-selective control of weeds. Crops are also to be understood as including those which have been rendered tolerant to herbicides or classes of herbicides by means of conventional plant-breeding or genetic-engineering methods. The weeds to be controlled may be both mono- and dicotyledonous weeds such as Stellaria, Nasturtium, Agrostis, Digitaria, Avena, Setaria, Sinapis, Lolium, Solanum, Echinochloa, Scirpus, Monochoria, Sagittaria, Bromus, Alopecurus, Sorghum halepense, Rottboellia, Cyperus, Abutilon, Sida, Xanthium, Amaranthus, Chenopodium, Ipomoea, Chrysanthemum, Galium, Viola and Veronica.

The examples which follow illustrate the invention in greater detail without limiting it.

Preparation examples:

Example H1: Preparation of ethyl 2-bromomethyl-6-trifluoromethylnicotinate:

434.4 g (1.866 mol) of ethyl 2-methyl-6-trifluoromethylnicotinate (preparation similar to *Heterocycles* 129, *46*, **1997**) and 398.5 g (2.239 mol) of N-bromosuccinimide in 3 500 ml of carbon tetrachloride in the presence of 30.6 g (0.1866 mol) of α,α-azaisobutyronitrile are heated at 75°C, with irradiation from a 150 Watt lamp. After 3 hours, the reaction is terminated, the mixture is cooled to 15°C and precipitated succinimide is removed by filtration. After evaporation of the solvent, the residue is distilled under reduced pressure. This gives ethyl 2-bromomethyl-6-trifluoromethylnicotinate as an oily product (260.2 g, 44.7% of theory, b.p. 74°C/0.04 mmHg).

Example H2: 2-(2-Methoxyethoxymethyl)-6-trifluoromethylnicotinic acid:

At room temperature,177.2 g of ethyl 2-bromomethyl-6-trifluoromethylnicotinate are dissolved in 3 000 ml of toluene and reacted with 398 ml (1.704 mol) of a 21% ethanolic solution of sodium ethoxide. After 8 hours at room temperature, 1500 ml of ethanol and 100 ml of 30% aqueous sodium hydroxide solution are added with vigorous stirring, and the

reaction mixture is stirred at this temperature for another 4 hours. The reaction mixture is poured into water and extracted with ethyl acetate, and the aqueous phase is acidified to pH 1. Following extraction with ethyl acetate, drying over sodium sulfate, evaporation under reduced pressure and trituration with hexane, pure 2-(2-methoxyethoxymethyl)-6-trifluoromethylnicotinic acid is obtained in the form of white crystals of melting point 62-63°C.

Example H3: 4-Hydroxy-3-[2-(2-methoxyethoxymethyl)-6-trifluoromethylpyridine-3-carbonyl]-bicyclo[3.2.1]oct-3-en-2-one:

24.9 g (0.1 mol) of 2-(2-methoxyethoxymethyl)-6-trifluoromethylnicotinic acid are dissolved in 200 ml of methylene chloride and 20 ml of oxalyl chloride, and 0.1 ml of dimethylformamide is then added dropwise. After the strong evolution of gas has ceased, triethylamine (27.9 ml, 0.2 mol), dimethylaminopyridine (1.22 g, 0.01 mol) and 15.2 g (0.11 mol) of bicyclo[3.2.1]octane-2,4-dione are added at a temperature of from 0 to 5°C. After 3 hours at 22°C, the reaction mixture is extracted with 2 N hydrochloric acid. The methylenechloride phase is separated off, washed with water and then extracted with 10% aqueous sodium bicarbonate solution, dried over sodium sulfate and concentrated. This gives 36.9 g (100% of theory) of 4-oxobicyclo[3.2.1]oct-2-en-2-yl 2-(2-methoxyethoxymethyl)-6-trifluoromethylnicotininate as an oil, which can be used further without purification.

36.9 g (0.1 mol) of 4-oxobicyclo[3.2.1]oct-2-en-2-yl 2-(2-methoxyethoxymethyl)-6-trifluoromethylnicotinate and 27.9 ml (0.2 mol) of triethylamine are dissolved in 400 ml of acetonitrile. At a temperature of 22°C, 0.92 ml (0.01 mol) of acetone cyanohydrin is added. After 18 hours at 22°C, the reaction mixture is poured into a water/2 N hydrochloric acid mixture and extracted with ethyl acetate. The ethyl acetate phase is washed with water and then with concentrated sodium chloride solution, dried over sodium sulfate and concentrated, and the residue is triturated with hexane. Filtration gives 27.9 g (75.6% of theory) of 4-hydroxyl-3-[2-(2-methoxyethoxymethyl)-6-trifluoromethylpyridine-3-carbonyl]bicyclo[3.2.1]oct-3-en-2-one in the form of white crystals (m.p. 55-56°C).

Example H4: 3-(2-Hydroxy-4-oxobicyclo[3.2.1]oct-2-en-3-carbonyl)-6-trifluoromethylpyridin-2-yl methyl acetate:

5.0 g (1 mmol) of 4-hydroxy-3-(2-methyl-1-oxy-6-trifluoromethylpyridin-3-carbonyl)-bicyclo[3.2.1]oct-3-en-2-one (preparation as described in WO 00/15615) are dissolved in 100 ml of toluene and, in the presence of 6.9 ml (0.073 mol) of acetic anhydride, heated at reflux temperature for 10 hours. The mixture is then partitioned between water and ethyl acetate and the organic phase is dried over sodium sulfate and concentrated under reduced pressure. The residue that remains is chromatographed on silica gel. The viscous oil obtained by eluting with a mixture of toluene, ethyl alcohol, dioxane, triethylamine and water (100:40:20:20:5 parts by volume) is dissolved in ethyl acetate and washed successively with 10% hydrochloric acid and water. The organic solution is dried over Na_2SO_4 and concentrated, giving 2.14 g (38%) of pure 3-(2-hydroxy-4-oxobicyclo[3.2.1]oct-2-ene-3-carbonyl)-6-trifluoromethylpyridin-2-ylmethyl acetate in the form of an oil. **^{1}H-NMR** (250 MHz, $CDCl_3$): 17.06 (s), 1H; 7.67 (s), 2H; 5.27 (d, J = 12.5 Hz), 1H; 5.20 (d, J = 12.5 Hz), 1H; 3.18, (t, J = 5.0 Hz), 1H; 2.92, (t, J = 5.0 Hz), 1H; 2.29-1.98 (m), 4H; 2.00, (s), 3H; 1.81-1.73 ppm (m), 2H.

Example H5: 4-Hydroxy-3-(2-oxiranylmethoxymethyl-6-trifluoromethylpyridine-3-carbonyl)-bicyclo[3.2.1]oct-3-en-2-one:

5 g (0.013 mol) of 3-(2-hydroxy-4-oxobicyclo[3.2.1]oct-2-ene-3-carbonyl)-6-trifluoromethyl-pyridin-2-ylmethyl acetate are dissolved in 60 ml of methanol/water (3:1 mixture), and 1.4 g (0.046 mol) of lithium hydroxide hydrate are added a little at a time at a temperature of 22°C. After 3 hours at 22°C, the reaction mixture is poured into ethyl acetate and 10% hydrochloric acid, and the organic phase is washed three times with water, dried with sodium sulfate and concentrated. This gives 4.1g of 4-hydroxy-3-(2-hydroxymethyl-6-trifluoromethylpyridine-3-carbonyl)bicyclo[3.2.1]oct-3-en-2-one as an oil which can be reacted further without purification.

1.5 g of 4-hydroxy-3-(2-hydroxymethyl-6-trifluoromethylpyridine-3-carbonyl)-bicyclo[3.2.1]oct-3-en-2-one are dissolved in 15 ml of dimethylformamide and, at room temperature, treated with 0.4 g of sodium hydride (80% suspension in oil, 0.013 mol), a little at a time. After 15 minutes at a temperature of 22°C, 3ml (0.036 mol) of epibromohydrin are added dropwise,

and the reaction mixture is stirred at this temperature for another 18 hours. Ethyl acetate is then added, and the mixture is acidified to pH 3 using 10% hydrochloric acid and extracted with ethyl acetate. The organic phase is dried over sodium sulfate and the crude product is purified chromatographically (mobile phase: toluene/ethyl alcohol/dioxane/triethylamine/water 100:40:20:20:5 parts by volume). This gives the title compound (triethylamine salt) in the form of a yellowish resin, which is released similarly to example H4. Trituration with hexane gives 600 mg of pure 4-hydroxy-3-(2-oxiranylmethoxy-methyl-6-trifluoromethylpyridin-3-carbonyl)bicyclo[3.2.1]oct-3-en-2-one of melting point 54-56°C.

Example H6: (5-Hydroxy-1,3-dimethyl-1H-pyrazol-4-yl)-[2-(2-methoxyethoxymethyl)-6-trifluoromethylpyridin-3-yl]methanone:

1.0 g (0.004 mol) of 2-(2-methoxyethoxymethyl)-6-trifluoromethylnicotinic acid is dissolved in 10 ml of oxalyl chloride. Three drops of dimethylformamide are added, and the mixture is stirred at room temperature for 1 hour. The mixture is then concentrated using a rotary evaporator, and the residue (2-(2-methoxyethoxymethyl)-6-trifluoromethylnicotinoyl chloride) is taken up in 10 ml of methylene chloride. At a temperature of 0°C, 0.84 ml (0.006 mol) of triethylamine and 0.45 g (0.004 mol) of 2,5-dimethyl-2,4-dihydropyrazol-3-one are added. After 2 hours at a temperature of 22°C, the solvent is removed using a vacuum rotary evaporator, and the residue that remains is dissolved in 10 ml of acetonitrile and, to rearrange the intermediate (2,5-dimethyl-2H-pyrazol-3-yl 2-(2-methoxyethoxymethyl)-6-trifluoromethylnicotinate), admixed with 0.1 ml of acetone cyanohydrin and 1.13 ml (0.008 mol) of triethylamine. The reaction solution is stirred at room temperature for four hours and then concentrated. The syrup that remains is chromatographed on silica gel. The viscous oil obtained by eluting with a mixture of toluene, ethyl alcohol, dioxane, triethylamine and water (100:40:20:20:5 parts by volume) is dissolved in ethyl acetate and washed successively with 10% hydrochloric acid and water. The organic solution is dried over Na_2SO_4 and concentrated, giving 0.93 g of (5-hydroxy-1,3-dimethyl-1H-pyrazol-4-yl)-[2-(2-methoxyethoxymethyl)-6-trifluoromethylpyridin-3-yl]methanone in the form of a viscous oil. ^{1}H NMR (300 MHz, $CDCl_3$, δ in ppm): 7.81, (d, J = 6 Hz), 1H; 7.74, (d, J = 6 Hz), 1H; 4.84, (s), 2H; 2H: 3.71, (s), 3H; 3.59, (t, J = 6 Hz) 2H; 3.38, (dd, J 4.0, 3.0 Hz), 1H; 3.26, (s), 3H; 1.82 ppm, (s), 1H.

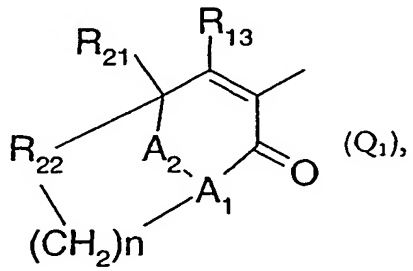
In the table below, in the case of rings, the ring attachment points for the substituents A_1 and A_2 are at the carbon atom which is marked "C", for example

, in the case of open-chain structures, "$(CH_3)_2C$" denotes, for example,  .

In the formula A-Q, Q denotes Q_1



(Q_1),

and Q_1 denotes the following radicals B:

Biological examples

Example B1: Herbicidal action before emergence of the plants (pre-emergence action)

Monocotyledonous and dicotyledonous test plants are sown in standard soil in pots. Immediately after sowing, the test substances are sprayed on at an optimum dosage (500 l of water/ha) as an aqueous suspension (prepared from a wettable powder (example F3, b) according to WO 97/34485) or emulsion (prepared from an emulsion concentrate (example F1, c) according to WO 97/34485). The test plants are then grown under optimum conditions in a greenhouse.

After a test period of 4 weeks, the test is evaluated using a 9-level scale of ratings (1 = complete damage, 9 = no effect). Ratings of 1 to 4 (in particular 1 to 3) mean good to very good herbicidal action.

Example B2: Post-emergence herbicidal action

Monocotyledonous and dicotyledonous test plants are grown in standard soil in pots. At the 2- to 3-leaf stage of the test plants, the test substances are sprayed at optimum dosage (500 l of water/ha) as an aqueous suspension (prepared from a wettable powder (example F3, b) according to WO 97/34485) or emulsion (prepared from an emulsion concentrate (example F1, c) according to WO 97/34485). The test plants are then grown further under optimum conditions in a greenhouse.

After a test period of 2 to 3 weeks, the test is evaluated using a 9-level scale of rating (1 = complete damage, 9 = no effect). Ratings of 1 to 4 (in particular 1 to 3) mean good to very good herbicidal action.
